

Employee Asset Request Module

Process & Design Rationale

1. Purpose of the Module

The Employee Asset Request module was designed to provide a **structured, auditable, and controlled** process for requesting, approving, and assigning company assets (e.g., laptops, phones, monitors) to employees.

The primary goals were:

- Prevent incorrect or duplicate asset assignments
- Ensure accountability through approvals
- Provide visibility and reporting for management
- Integrate seamlessly with Odoo's existing HR, Assets, and Mail features

2. Business Process Flow

Step 1: Asset Request (Employee)

- An employee creates an asset request.
- The employee is automatically linked to the logged-in user.
- The employee selects:
 - Asset Type (from available assets model)
 - Quantity
 - Reason
- The request starts in **Draft state**.

Reasoning

Auto-linking the employee avoids manual errors and prevents users from creating requests on behalf of others.

M Min Min - NOW
Creating a new record...

Step 2: Submission & Notification

- When the employee clicks **Submit**:
 - The request state changes to **Submitted**
 - An **email notification** is sent
 - A **mail activity** is created for the employee's manager

Reasoning

Using Odoo's mail.thread and mail.activity.mixin ensures:

- Full communication history
- Standardized notifications
- No need for custom messaging logic

Activity: Asset Request Approval

Deadline: 12/18/2025

Internal communication: Replying will post an internal note. Followers won't receive any email notification.

Dear Mitchell Admin,

Min Min has just assigned you the following activity:

Step 3: Manager Approval

- Only the **selected manager** can see the **Approve / Reject** buttons
- This is controlled by:
 - A computed field (is_current_manager)

Reasoning

This guarantees:

- Approval authority is respected
- Other users cannot act on requests not assigned to them
- UI-level access control improves usability and security

OTHER

Asset Manager ?

☐

Asset User ?

☐

Step 4: Asset Assignment (Wizard)

- Manager opens an Asset Assignment Wizard
- Only available assets are shown
- Quantity validation ensures:
 - Selected assets = requested quantity
- Upon confirmation:
 - Assets are marked as Assigned
 - Request state changes to Assigned
 - Assignment date is recorded

Reasoning

Using a wizard:

- Prevents partial or incorrect assignments
- Keeps the main form clean
- Enforces business rules before committing changes

3. Asset Availability Control

- The module uses the existing account.asset model
- Asset availability is determined by:
 - Asset state (Available / Assigned)
 - Asset Model relationship when applicable

Reasoning

Reusing account.asset avoids:

- Duplicate asset-type models
- Data inconsistency
- Extra maintenance overhead

4. Access Control & Visibility

User Role Access

Employee Sees only their own requests

Manager Sees all requests

This is enforced using:

- Record rules
- Domain filters
- Computed fields

Reasoning

This ensures data privacy while still allowing oversight by management.

☐ AR/2025/00001	Min Min	Management / Administration	Laptop	12/18/2025 21:49:11	Assigned

5. Reporting & Analysis

- Requests and assignments are available in:
 - List View
 - Pivot View
 - Grouped views (e.g., by Employee)
- Create button is disabled in report views

Reasoning

Built-in reporting allows:

- Asset utilization tracking
- Audit readiness
- No need for external reporting tools

6. Technical Design Principles

- Odoo 17 enterprise
- Uses:
 - mail.thread for chatter
 - mail.activity.mixin for approvals
 - Wizards for transactional actions
- Minimal custom logic, maximum reuse of Odoo core

Reasoning

This ensures:

- Long-term maintainability
- Upgrade safety
- Consistency with Odoo best practices

7. Conclusion

The module was designed to balance control, usability, and scalability.

By leveraging Odoo's native features and enforcing clear approval rules, the solution provides a reliable asset management workflow suitable for real-world business operations.
